

## Philips Teletrol management system

The Philips Teletrol management system gives complete control of lighting, heating, ventilation, air-conditioning, cooling and the associated power consumption. All of the data is available from a single information source. This means that users such as the petrol station operators and head office can easily access this data and use it for their decision-making processes.

Recurrent decisions can be implemented by the system automatically to guarantee and optimise the targeted energy savings.

Philips Teletrol System allows:

- reduction of power consumption and maintenance costs;
- monitoring of the quality of all systems and perform preventive maintenance;
- improving food safety management
