

## Using vegetable life for fuel wrong choice: report

**Using vegetable life to produce energy like ethanol is inefficient as it is costly and takes away fertile land from human food consumption uses, a recently published study by the World Resources Institute said**

Western governments should stop supporting the biofuel industry because it has helped drive up food prices. In the US, for example, ethanol production takes up a significant proportion of the corn crop, the study said.

The potential of vegetable-derived fuel for reducing pollution by helping to decrease dioxide emissions is limited, the research said.
